

Passive Cold Chain (Shipping/storage materials)

➤ Control materials

- There are several means for monitoring or controlling the temperature.
- Thermometers: they must be present at all levels in the cold chain (freezer, refrigerator, cool box, vaccine carrier).
- Probe thermometers: can be read from a distance, namely the reading is taken from outside the compartment where the probe is.

The other types of thermometers are placed in the refrigerated or freezer compartment and can indicate a negative or positive temperature.
